Stroke 2 (compression) air is compressed to high. extent, raising temperature. Stroke 3 (power) diesel is injected, high air. temperature ignites diesel. Stroke 4 (exhaust) burnt gases are expelled from. the engine.

A.5 DIESEL ENGINE CYCLE Diesel engines may operate at a very fast combustion rate, approaching constant volume for most of the fuel. Such an operation is obtained when the delay period is long enough that the fuel injected is quite well mixed and most is evaporated before the combustion. However, such an operation is undesirable, due to the

Diesel vs. Otto Engine The main difference between the Diesel and Otto engine is: The burning of the fuel. • In a Gasoline engine the air/fuel mixture enters the cylinder and creates a stoichiometric homogeneous mixture, which is ignited and the flame travels from the spark and outwards to the liner.

The Four-Stroke diesel engine works on the following cycle: 1. Suction Stroke – With pistons moving downwards and the opening of the inlet valve creates the suction of clean air into the cylinders. Diesel Suction Stroke. 2. Compression – With the closing of Inlet valve the area above the piston gets closed.
