DYNAMICAL SYSTEMS AND DIFFERENTIAL EQUATIONS Dynamical Systems can be considered, at present, as a way to describe evolution problems with respect to time, let them be given by ordinary or partial differential equations or by discrete transformations. Both the qualitative and the quantitative aspects of the systems fall in this study.

In physics, a dynamical system is described as a "particle or ensemble of particles whose state varies over time and thus obeys differential equations involving time derivatives." [3] In order to make a prediction about the system's future behavior, an analytical solution of such equations or their integration over time through computer simulation is realized.

1.1 Differential equations Differential equations play a very important role in Engineering and Science. Many problems lead to one or several differential equations that must be solved. Most attention has been given to linear equations in the literature; several analytical methods have been developed to solve that type of equations.

Introduction to Dynamical Systems

In mathematics, stability theory addresses the stability of solutions of differential equations and of trajectories of dynamical systems under small perturbations of initial conditions. The heat equation, for example, is a stable partial differential equation because small perturbations of initial data lead to small variations in temperature at a later time as a result of the maximum principle. In partial differential equations one may measure the distances between functions using L_p norms or the

Hirsch, Devaney, and Smale 's classic Differential Equations, Dynamical Systems, and an Introduction to Chaos has been used by professors as the primary text for undergraduate and graduate level courses covering differential equations. It provides a theoretical approach to dynamical systems and chaos written for a diverse student population among the fields of mathematics, science, and engineering.

Types of dynamical systems. The types of deterministic dynamical systems we will consider here are: Discrete-time dynamical systems (iterated functions) Cellular automata; Ordinary Differential Equations (ODEs) Partial Differential Equations (PDEs) In these models, the quantities of interest depend on one or several independent variables. Often, these variables include time and/or space.
