General Relativity Without Calculus 13 interpret them): ($t' = \gamma (t - vx/c^2)$, $x' = \gamma (x - vt)$ where c represents the speed of light (about 300,000 kilometers per second) and $\gamma = 1/\sqrt{1 - v^2/c^2}$. The special theory of relativity, developed by Einstein in 1905, boils down to analyzing the consequences of these transformations.

General Relativity, at its core, is a mathematical model that describes the relationship between events in space-time; the basic finding of the theory is that the relationship between events in the same as the relationship between points on a manifold with curvature, and the geometry of that manifold is determined by sources of energy-momentum and their distribution in space-time.

~~What are the prerequisites to studying general relativity?~~

ometry and general relativity require mathematical entities of still higher rank. The tools of vector analysis are simply incapable of allowing one to write down the governing laws in an invariant form, and one has to adopt a different mathematics from the vector analysis taught in the freshman and sophomore years. Tensor calculus is that ...
