Plasmids that incorporate new DNA are called recombinant plasmids Recombinant plasmids are used in biotechnology to carry DNA that codes for substances, such as human insulin or growth hormone, into bacteria. Bacteria that contain the recombinant plasmids can then be grown commercially to provide the needed substance.

This "recombining" of DNA is called RECOMBINANT DNA. Extracting a gene from one DNA molecule and inserting it into another requires precise "cutting and pasting." To carry out this procedure, a piece of DNA containing the gene of interest must be cut out of a chromosome and "pasted" into a bacterial plasmid.
