The availability of silicon to plants varies depending on the soil. Tropical/subtropical soils highly weathered, low in base saturation, and acidic are known to be low in plant-available silicon. Organic and sandy soils also contain low levels of silicon. Further, soilless mixes are silicon deficient.

Tropical soils vary greatly in their principal chemical and physical properties, such as parent material, soil structure, drainage regime, and age. Variations in soil properties play an important role in the different types of tropical forest ecosystems; however, we do not know much about their controlling influence on the distribution of most tropical tree species.
